

BOTCONVERSA

Product Strategy & Roadmap

Vitaly Streluk · 2026-06-12 · generated from state, v1.0

Data status: 0 confirmed · 26 estimates pending validation · 18 public-source · 0 revised by internal data. Every number in this document carries its status inline; the full ledger is in Appendix C.

TL;DR

BotConversa sits at the intersection of a real market gap and a closing window: WhatsApp automation has become table stakes for Brazilian micro-businesses, but every competitor is either priced for enterprises (Zenvia at 600BRL/month [source: zenvia.com/en/prices/ (verified 2026-06-12) — re-verify before external use]/month entry, Blip at 1023BRL/month [source: botaiahub.com.br/ferramentas/take-blip/ (verified 2026-06-12) — re-verify before external use]/month minimum) or priced in USD with Brazil as an afterthought (ManyChat WhatsApp access starting at 29/69USD/month [source: <https://flowgent.ai/blog/manychat-pricing>; <https://setsmart.io/blog/manychat-pricing> (verified via third-party articles 2026-06-12) — re-verify before external use], WATI at 59USD/month [source: wati.io/pricing (verified 2026-06-12) — re-verify before external use]). The SMB-native, BRL-priced, vertical-deep position is unclaimed — and the strategy's job is to occupy it before SocialHub or a re-energized Toolzz does. The recommended path is a three-horizon sequence: fix the measurement blind spot and close the compliance exposure in H1, deliver the outcome customers are actually paying for (end-to-end appointment automation) in H2, and build the data moat in H3 that no global player can replicate without years of Brazilian SMB vertical data. The monetization model — feature-gated flat-rate tiers at 129BRL/month [→ Validate: Recommended Starter tier price: R\$129/month (flow builder, WhatsApp only, ≤3 published flows).], 249BRL/month [→ Validate: Recommended Pro tier price: R\$249/month (vertical templates, unlimited flows, structured CRM capture). New positioning.], and 449BRL/month [→ Validate: Recommended Growth tier price: R\$449/month (vertical benchmarks, AI flow optimizer, priority support). New tier aligned with H3 feature delivery.]/month — is conditionally sound; it avoids the North Star gaming risk that usage-based pricing would create, and it gives BotConversa a defensible price floor well below 1200–1500BRL/month [→ Validate: Monthly cost of a part-time receptionist in Brazil (CLT social charges included): R\$1,200–R\$1,500/month. Pricing ceiling for SMB automation.] — the cost of the SMB owner's real alternative: a part-time receptionist. The verdict is conditional because five baseline measurements are currently null, and a strategy built on null inputs cannot be green regardless of how internally consistent it is.

The Market Moment

WhatsApp automation in Brazil crossed a threshold in 2026: it is no longer a competitive differentiator for micro-businesses — it is a minimum requirement to compete. Beauty salon owners who still manage bookings on a personal WhatsApp number face LGPD compliance exposure, cannot share the inbox across staff, and have no conversation history for auditing. The shift from 'nice to have' to 'must have' is the condition that makes the market attractive and the timing urgent.

The competitive field has a structural gap. Blip (1023BRL/month [source: botaihub.com.br/ferramentas/take-blip/ (verified 2026-06-12) — re-verify before external use]/month minimum) and Zenvia (entry at 600BRL/month [source: zenvia.com/en/prices/ (verified 2026-06-12) — re-verify before external use]/month plus a 649BRL [source: zenvia.com/en/prices/ (verified 2026-06-12) — re-verify before external use] setup fee) are designed for banks and retailers, not beauty salons. ManyChat requires WhatsApp access at 29/69USD/month [source: <https://flowgent.ai/blog/manychat-pricing>; <https://setsmart.io/blog/manychat-pricing> (verified via third-party articles 2026-06-12) — re-verify before external use]/month in USD with no Brazil-localized pricing yet available — and its per-conversation pass-through cost (0.02–0.08USD/conversation [source: help.manychat.com/hc/en-us/articles/14281380243740-WhatsApp-pricing-guide (verified 2026-06-12) — re-verify before external use]) stacks on top of Meta's own per-message billing, which changed from per-conversation to per-message in January 2026 (2026-01 effective date [source: socialhub.pro 'Preço WhatsApp Business API Brasil 2026' — re-verify before external use]), already the top source of billing anxiety among Brazilian SMBs. Toolzz AI enters at 399BRL/month [source: <https://www.toolzz.com.br/bots> (fetched directly 2026-06-12) — re-verify before external use]/month — above the micro-business comfort zone for a single-product tool. WATI at 59USD/month [source: wati.io/pricing (verified 2026-06-12) — re-verify before external use]/month is USD-priced and charges Brazil-bound template messages at approximately three times the rate of lower-cost markets (3x (vs India) [source: chatarmin.com 'Wati Pricing 2026' (verified 2026-06-12) — re-verify before external use]). The gap between 'enterprise CPaaS' and 'global USD-priced tool' is exactly where a BRL-native, SMB-first, vertically specialized product wins.

The window is measured in months, not years. SocialHub is already investing in this positioning — publishing comparison content targeting BotConversa directly — and its reported entry price of 197BRL/month [→ Validate: SocialHub's WhatsApp chatbot platform starts from R\$197/month with a 7-day free trial and no setup fee.] signals intentional competition for the same customer. The strategic value of acting in H1 is not feature delivery; it is establishing measurement infrastructure so that H2 investment lands with evidence, not hypothesis.

What the Customer Needs (and Where Automation Currently Breaks)

The voice-of-customer data across three target verticals — beauty salons, clinics, and pet shops — converges on a single measurable pain point: no-shows. A clinic losing five appointments per week at a typical ticket value loses approximately 6000BRL/month [→ Validate: A clinic with 5 no-shows/week at R\$300 avg ticket loses ~R\$6,000/month in unrealized revenue.] per month in unrealized revenue while fixed costs (rent, staff, software) continue running. WhatsApp appointment reminders reduce no-shows by 30–50% [source: aisensy.com 'WhatsApp for Spa and Salons' (2026) — re-verify before external use] for beauty and spa businesses; adding a two-hour reminder on top of a twenty-four-hour reminder reduces clinic no-shows by a further 25–35% [source: achiya-automation.com 'WhatsApp Bot for Clinics 2026' — re-verify before external use]. This is the clearest, fastest-payback ROI in the product.

But no-show reduction is only the first failure mode. The deeper problem — the one that limits how much automation BotConversa can sell — is that automation breaks at the slot-filling step. When a customer cancels, the bot can confirm the cancellation but cannot rebook the empty slot because waitlist data is unstructured: the customer's preferred professional, preferred time, and procedure type were never captured in a queryable form. The bot 'works for sending but not for managing.' This is the problem H2's Structured CRM Data Capture initiative is designed to

solve, and it is a dependency for H3's benchmark feature — benchmarks require structured, comparable data across accounts.

There is a third failure mode that is also a compliance risk: flows that trap end-users with no path to a human agent. Brazilian end-users have documented this pattern on Reclame Aqui, and WhatsApp's own commerce policy requires a clear escalation path. The escape-hatch enforcement in H1 Initiative 2 is not a feature — it is a compliance obligation that affects every flow currently in production. Shipping it as part of an activation redesign, rather than as a standalone safety patch, is the right sequencing because it puts the escape hatch in front of every new user at the moment they build their first flow.

The North Star and Its Limits

Containment Rate — the percentage of inbound WhatsApp conversations that reach a defined terminal state without human intervention — was chosen as the North Star because it measures what the SMB owner is actually paying for: their phone not ringing at 11pm. A rising Containment Rate means the bot is working. A flat Containment Rate despite growing conversation volume means BotConversa has become a broadcast tool, not an automation tool — a leading indicator of churn before the customer can articulate why they are unhappy.

The metric has four gaming risks that the framework called out explicitly and that must be monitored as the product scales. The most structurally dangerous is the billing conflict: if BotConversa ever moves to usage-based pricing, it acquires a financial incentive to generate conversations rather than resolve them quickly — because more conversations means more revenue, even as Containment Rate declines. This is why the monetization step rejected usage-based pricing not just on customer-experience grounds but on North Star integrity grounds. The two decisions are coupled.

Containment Rate cannot be measured today because terminal states are not yet a required schema component of published flows. The H1 escape-hatch enforcement is therefore a prerequisite for CR instrumentation — not just a compliance fix. This sequencing constraint is non-obvious and was identified and fixed during the review step: H1 Initiative 2 (escape hatch) must ship before H1 Initiative 1 (CR instrumentation) can produce valid data.

Three-Horizon Roadmap: Sequence Is the Strategy

The roadmap is intentionally lean — two or three initiatives per horizon — because BotConversa's most dangerous failure mode is not moving too slowly; it is shipping H3 features before H1 infrastructure exists. The horizons are a dependency chain, not a parallel workflow.

H1 (Foundation, months zero through three) has two objectives that must be completed before anything else is credible. First: all eleven North Star and dashboard metrics must move from null to baselined — including Containment Rate, Time-to-First-Automation, Flow Error Rate, Appointment Confirmation Rate, and Human Handoff Rate. Without these baselines, every H2 success metric is a directional hope. Second: the Activation Redesign must ship the escape-hatch enforcement, the guided setup flow, and the extended trial (the activation vehicle). The account activation rate target — set at 50% [→ Validate: Account Activation Rate floor benchmark (no-code SaaS category): 50% within 14 days of signup.] as the minimum floor, with the actual target set at ten percentage points above the measured baseline — is the primary leading indicator that H2 investment will have an activated user base to land in.

H2 (Retention, months three through nine) delivers the vertical depth that current competitors cannot match: composable booking automation templates for beauty salons, clinics, and pet shops, built against the exact failure modes documented in the VoC research. Templates must be validated with design partner accounts across all three verticals before general availability. The Structured CRM Data Capture initiative ships alongside templates because templates without structured data only solve the no-show reminder problem, not the slot-filling problem. H2 does not expand to new channels. Channel expansion is gated on H2 churn and CR targets — the placeholder values in the H3 objective will be filled at the H1/H2 boundary review when baselines exist.

H3 (Differentiation, months nine through eighteen) makes the moat structural. Vertical Performance Benchmarks — showing each SMB owner how their no-show rate, booking confirmation rate, and Containment Rate compare to peer businesses in their vertical and city — are the feature that no global competitor can replicate without years of Brazilian SMB data. The longer an account stays on BotConversa, the more relevant their benchmark position becomes; switching to a competitor resets their longitudinal data position entirely. The Instagram DM expansion remains exploratory: it moves to committed only if H2 churn analysis identifies channel gaps as the dominant exit-survey reason. If churn is driven by flow quality or pricing, channel expansion is a distraction.

- H1 gate: All eleven baselines non-null; escape hatch enforced on all new flows; account activation rate $\geq 50\%$ [→ Validate: Account Activation Rate floor benchmark (no-code SaaS category): 50% within 14 days of signup.] absolute floor
- H2 gate: Logo Churn and Containment Rate at or above targets set at H1 boundary review (values TBD from baselines)
- H3 commitment decision: made at H2 boundary review, not now

Monetization: Why Flat-Rate Wins Here

Three monetization models were evaluated and two were rejected. Usage-based pricing (per conversation) fails on two independent grounds: it creates a direct conflict of interest with the North Star metric, and it compounds the billing unpredictability that Meta's January 2026 per-message billing change (2026-01 effective date [source: socialhub.pro 'Preço WhatsApp Business API Brasil 2026' — re-verify before external use]) already introduced for Brazilian SMBs. Outcome-based pricing (per confirmed booking) is the theoretically correct value alignment but is not executable without verified booking-system integrations that do not yet exist. The freemium-with-cap model solves the wrong problem: in a market where automation is table stakes, the barrier is not awareness — it is the gap between 'I want automation' and 'I built a working flow.' A fifteen-day trial solves the activation problem without creating a permanent cap-anxiety that flat-rate avoids.

The recommended model — feature-gated flat-rate tiers at 129BRL/month [→ Validate: Recommended Starter tier price: R\$129/month (flow builder, WhatsApp only, ≤ 3 published flows).], 249BRL/month [→ Validate: Recommended Pro tier price: R\$249/month (vertical templates, unlimited flows, structured CRM capture). New positioning.], and 449BRL/month [→ Validate: Recommended Growth tier price: R\$449/month (vertical benchmarks, AI flow optimizer, priority support). New tier aligned with H3 feature delivery.]/month — differentiates tiers by vertical depth and intelligence, not by conversation volume. Starter covers the basics; Pro unlocks the vertical templates and CRM data capture that H2 ships; Growth unlocks the benchmarks and AI optimizer that H3 ships. The pricing ladder is therefore a forward

commitment: if H2 and H3 deliver, the upgrade motion is product-led. If they do not deliver, the ladder has no pull.

The break-even analysis is cost-sensitive in a way that the original sensitivity table obscured: at the target tier mix (forty percent Starter, forty-five percent Pro, fifteen percent Growth), the account count required to break even ranges across a factor of two depending on whether the actual cost base is the low, mid, or high estimate in the sensitivity table. The 50000BRL/month [→ Validate: BotConversa monthly operational cost (team + infrastructure + fixed Meta costs, excl. variable pass-through) — estimated R\$50,000/month.] cost estimate is the most uncertain input in the model. The pricing structure is sound regardless of which cost scenario is correct — but the urgency of driving accounts from Starter to Pro scales directly with actual costs. If costs are at the high scenario, the H2 upgrade motion is not aspirational; it is existential. The pricing ceiling is anchored by the SMB owner's real alternative: a part-time receptionist at 1200–1500BRL/month [→ Validate: Monthly cost of a part-time receptionist in Brazil (CLT social charges included): R\$1,200–R\$1,500/month. Pricing ceiling for SMB automation.]/month. At 449BRL/month [→ Validate: Recommended Growth tier price: R\$449/month (vertical benchmarks, AI flow optimizer, priority support). New tier aligned with H3 feature delivery.]/month for the Growth tier, BotConversa is well below that ceiling even at its most expensive offering.

What Needs to Be True: The Conditional Claims

The strategy is internally consistent but conditionally valid. Five unmeasured values materially affect whether the recommendations hold at the level of precision implied. These are not uncertainties to note and move past — they are the first deliverables of H1.

The most consequential unknown is the current account base and MRR ([→ Validate: BotConversa current MRR and active account count baseline.]). The sensitivity table's break-even account counts mean different things depending on whether BotConversa currently has one hundred accounts or five hundred. If the current base is already near the S3 break-even at the low cost assumption, H2 investment is de-risked. If it is significantly below, the model requires meaningful new-account growth alongside the upgrade motion.

The current Logo Churn Rate ([→ Validate: BotConversa monthly logo churn rate baseline — % of paying accounts cancelling per month.]) determines whether the problem is retention or acquisition. If monthly churn is above mid-single digits, pricing redesign alone will not fix it — the vertical templates must actually reduce churn before the monetization model can perform. The current Account Activation Rate ([→ Validate: BotConversa Account Activation Rate baseline — % of new signups publishing a live flow within 14 days.]) determines how aggressive the H1 activation targets should be and whether the fifteen-day trial is sufficient or whether the guided setup requires a more fundamental redesign. The current Containment Rate ([→ Validate: BotConversa Containment Rate baseline — % of conversations resolved without human intervention (accounts ≥30 conv/month.)) — the North Star — determines the starting point for every H2 improvement claim.

The strategy document cannot be finalized, and the H2 investment decision cannot be made with confidence, until these five claims are confirmed. The H1 instrumentation initiative exists precisely to close this gap. Until it does, the strategy is a conditional recommendation, not a committed plan.

- [→ Validate: BotConversa current MRR and active account count baseline.] — current account count and MRR: determines break-even distance and urgency of upgrade motion
- [→ Validate: BotConversa monthly logo churn rate baseline — % of paying accounts cancelling per month.] — current logo churn rate: determines whether retention or acquisition is the primary lever
- [→ Validate: BotConversa Account Activation Rate baseline — % of new signups publishing a live flow within 14 days.] — current account activation rate: sets the H1 target and determines trial-length sufficiency
- [→ Validate: BotConversa Containment Rate baseline — % of conversations resolved without human intervention (accounts ≥30 conv/month).] — current Containment Rate (CR): the North Star baseline without which H2 improvement claims are unanchored
- 50000BRL/month [→ Validate: BotConversa monthly operational cost (team + infrastructure + fixed Meta costs, excl. variable pass-through) — estimated R\$50,000/month.] — operational cost base: determines break-even account count and the urgency threshold for the H2 upgrade motion

Monetization — Verdict

Recommended model: Feature-gated flat-rate subscription tiers, differentiated by vertical depth and intelligence — not by conversation volume. Three tiers: Starter (R\$129/month, basic flow builder, WhatsApp only, up to 3 published flows), Pro (R\$249/month, vertical booking templates for beauty/clinics/pet shops, structured CRM data capture, unlimited flows), Growth (R\$449/month, vertical performance benchmarks, AI flow optimizer, priority support). Meta API pass-through costs are billed separately and transparently at zero markup — BotConversa does not profit from message fees. Pricing is annual-plan discounted (~20%) with monthly option available. A 15-day free trial replaces the current 'try before pay' friction. (See claims m01 through m05.). Verdict: CONDITIONAL — gated on data below.

This verdict is conditional on confirming:

- [→ Validate: BotConversa monthly logo churn rate baseline — % of paying accounts cancelling per month.]
- [→ Validate: BotConversa current MRR and active account count baseline.]
- [→ Validate: BotConversa Account Activation Rate baseline — % of new signups publishing a live flow within 14 days.]
- [→ Validate: Median inbound conversations per active BotConversa account per month.]
- 50000BRL/month [→ Validate: BotConversa monthly operational cost (team + infrastructure + fixed Meta costs, excl. variable pass-through) — estimated R\$50,000/month.]

Alternatives considered

- Usage-based pricing (per conversation or per resolved conversation): Two independent disqualifiers. First: the North Star (Containment Rate) is directly gamed by conversation-based billing — BotConversa would have a financial incentive to generate more conversations (re-engagement drips, broadcast sequences) rather than resolve them faster. This conflict of interest was explicitly flagged during framework design (Step 2 gaming risk #2) and cannot be mitigated with contractual safeguards alone. Second:

Meta changed Brazil WhatsApp API billing from per-conversation to per-message in January 2026, making cost unpredictability the top concern for Brazilian SMBs when evaluating chatbot platforms (claim c19). Stacking BotConversa's own usage fee on top of Meta's variable fee creates double exposure — the exact billing anxiety that the research showed drives switching decisions. Note: if a usage-based model were selected despite these disqualifiers, a cheaper-tier floor (a flat monthly minimum below which usage fees do not apply) would be mandatory to prevent churning low-volume accounts that cannot predict their monthly bill.

- Outcome-based pricing (per confirmed booking or per no-show prevented): Outcome-based pricing is the theoretically correct alignment with customer value — the owner pays only when the bot delivers a confirmed appointment. However, it is not executable with BotConversa's current architecture: (a) BotConversa can detect when a conversation reaches a 'booking confirmed' terminal state in the flow, but cannot verify whether the customer actually showed up — that data lives in the customer's booking system, not in BotConversa. (b) A fake 'booking confirmed' node could be trivially triggered by a bad actor to avoid paying. (c) Revenue would become fully variable, making it impossible to plan engineering investment or cost structure. Revisit if BotConversa builds native booking integrations with Simples Agenda, AgendaNet, or similar Brazilian SMB scheduling tools — at that point, verified show-rate data would make outcome pricing executable.
- Freemium with hard conversation cap (free tier up to N conversations/month): Hard caps create billing anxiety at the ceiling — SMB owners report they would rather pay a higher flat rate than watch a usage counter approach a limit mid-month. The 15-day free trial in the recommended model achieves the same acquisition function (let the owner see the bot work in their real WhatsApp before committing) without the ongoing cap anxiety. Freemium also risks attracting permanent non-payers who consume support and infrastructure resources without converting. In a market where WhatsApp automation is already table stakes (VoC signal from research), a freemium gate does not solve an awareness problem — it solves a willingness-to-pay problem, which is better addressed by shortening the perceived payback period (through vertical templates that deliver no-show reduction in week 1) than by deferring payment indefinitely.

Sensitivity

scenario	tierMix	blendedA RPU_R\$	accounts ToBreak Even	metaPas sthrough PerAcco unt_R\$	netReven uePerAcc ount_R\$	notes	costAssu mption_R \$
S1 — No upsell motion (mostly Starter)	80/18/2	148	338	120	148	Worst case. Most accounts stay on Starter and never adopt vertical templates. ARPU is below SocialHub	—

						's estimated entry price (claim c10). Viable only if account count is high (>300). Not a sustainable competitive position against Toolzz (R\$399 entry) because BotConversa would need to compete on price, not value.	
S2 — Current cohort baseline (estimated)	60/35/5	174	287	120	174	Estimated current state before Pro/Growth tier redefinition. Assumes current ~R\$197/month average maps roughly to the Pro tier in the new structure. Hypothesis only — actual ARPU is unknown (claim f06). The	—

						break-even at 287 accounts is likely reachable for a product with BotConversa's described market presence, but requires confirmation.	
S3 — Target mix (H2 vertical templates driving Pro upgrades)	40/45/15	214	234	120	214	BREAK-EVEN ANCHOR. Achievable if H2 vertical templates convert 45% of active accounts to Pro tier. At R\$214 blended ARPU, the break-even account count (234) is lower than most Brazilian B2B SaaS products at this stage need to support a 3-person team plus infrastructure. This is the scenario the	—

						roadmap is designed to enable.	
S4 — Growth-heavy (H3 benchmarks and optimizer driving premium adoption)	20/45/35	249	201	140	249	Best-case H3 state. Growth-tier accounts are higher-volume users (more conversations, higher Meta costs — reflected in R\$140 Meta estimate). However, at R\$449/month, BotConversa is still significantly below Toolzz AI's effective all-in cost for comparable SMBs. The ceiling is likely the point where a beauty salon owner compares R\$449/month against hiring a part-time receptionist	—

						{{claim:m06}}/month).	
S5 — Cost sensitivity at S3 tier mix, R\$75K/month costs	40/45/15	214	350	120	214	If actual operational costs are R\$75K/month (5-person team or equivalent), break-even at S3 tier mix requires 350 accounts — 50% more than the R\$50K base case. This is the more likely cost base for a funded product with engineering, CS, and product functions.	75000
S6 — Cost sensitivity at S3 tier mix, R\$100K/month costs	40/45/15	214	467	120	214	If actual operational costs are R\$100K/month (7–8 person team with infrastructure and marketing), break-even requires 467 accounts at S3 mix.	100000

						At this cost level, the S3 tier mix alone is insufficient — the pricing ladder must drive more accounts to Growth tier (R\$449) or account volume must exceed 400 before the model is sustainable. This is a plausible scenario for a post-seed company. The monetization recommendation does not change, but the H2 upgrade motion becomes non-optional, not aspirational.	
--	--	--	--	--	--	---	--

Break-even: At the R\$50K/month cost estimate (claim m01): Scenario S3 (40/45/15 tier mix, blended ARPU R\$214) requires ~234 accounts. At R\$75K/month: ~350 accounts. At R\$100K/month: ~467 accounts. The break-even is COST-SENSITIVE — the most uncertain variable. S3 tier mix is the investment target for H2, but the absolute account-count threshold depends entirely on actual costs (claim m01). The recommendation holds across all three cost scenarios; the urgency of the H2 upgrade motion scales with actual costs.

Appendix A — Feature Scoring Rubric

Per-criterion scores for every feature. Totals without a visible rubric are theater; this appendix is what makes the H3 prioritization auditable.

Criterion (weight)	Vertical Performance Benchmarks	Instagram DM Automation	Multi-Agent Team Inbox	AI Flow Optimizer
North Star Impact (0.25)	3	2	2	5
Retention / Switching Cost (0.2)	5	2	4	4
Competitive Differentiation (0.2)	5	1	2	4
Implementation Risk (0.15)	3	4	3	2
Time-to-Value (0.1)	2	4	3	2
Vertical Alignment (0.1)	5	3	2	4
TOTAL	3.9	2.4	2.65	3.75

Appendix B — Adversarial Self-Review

This document was attacked by a hostile-reviewer pass before rendering. Every P0 found was either fixed in the state or is declared below. A document that ships with its own critique is more trustworthy than a smooth one.

P0 — critical

- [FIXED] H2 success metrics referenced Appointment Confirmation Rate and Human Handoff Rate, but neither was in the H1 instrumentation scope. H2 Initiative 1 (Vertical Templates) requires Appointment Confirmation Rate $\geq 50\%$; H2 Initiative 2 (CRM Data Capture) requires Human Handoff Rate to drop $\geq 20\%$. Both metrics were in the framework's metric tree but absent from the six-metric first dashboard that H1 committed to instrumenting. At H2 evaluation time, both success metrics would have been unmeasurable. — Fixed in 03-roadmap.json: H1 Initiative 1 success metric expanded to explicitly require instrumentation of Appointment Confirmation Rate (claim f10) and Human Handoff Rate (claim f11) alongside the original six dashboard metrics. Two new baseline claims (f10, f11) added to the roadmap.
- [FIXED] H1 Initiative 2 success metric contained ' $\geq 60\%$ ' as a hard activation rate target with no claim record and no grounding. The notes acknowledged the number was 'directional' but directional targets in success metrics are still quantitative commitments. No industry benchmark, internal data, or competitive reference was cited to support 60% as the threshold. A target that is acknowledged to be made up in the same document that sets it is not a success metric — it is a placeholder. — Fixed in 03-roadmap.json: success metric rewritten as ' ≥ 10 percentage points above the H1-measured baseline, with a minimum absolute floor of 50%.' The 50% floor is now backed by claim r05 (no-code SaaS category benchmark, marked estimate). The absolute target is relative to measured baseline rather than an invented absolute.
- [FIXED] The Step 5 sensitivity table sensitized on tier mix (the variable BotConversa controls) but held the operational cost base constant at R\$50,000/month — the most uncertain variable in the entire model, recorded as a null estimate (claim m01). This produced a single break-even number (234 accounts) that appears precise but is entirely dependent on an unverified cost assumption. If actual costs are R\$75K/month the break-even is 350 accounts; at R\$100K/month it is 467 accounts — a 2x spread that changes the viability story from 'achievable' to 'requires significant growth.' A sensitivity table that doesn't sensitize on its most uncertain variable is reverse-engineering the answer. — Fixed in 05-monetization.json: two cost-sensitivity scenarios added (S5 at R\$75K/month, S6 at R\$100K/month) both at S3 tier mix. breakEven field updated to present the range (234/350/467 accounts) rather than a single number. The cost-sensitive nature of the break-even is now explicit.
- [FIXED] H1 listed 'Instrument the North Star Dashboard' as Initiative 1 and 'Activation Redesign + Escape Hatch' as Initiative 2, implying Initiative 1 could proceed independently. But the North Star (ARR) requires conversations to reach 'defined terminal states' — and those terminal states don't exist as an enforced schema requirement until Initiative 2 (escape hatch enforcement at publish time) ships. Instrumenting ARR before terminal states are defined produces data that counts user abandonment as resolution — gaming risk #1 from the framework, introduced by the framework's own implementation plan. — Fixed in 03-roadmap.json: H1 Initiative 1 success metric now contains an explicit ORDERING CONSTRAINT — 'ARR instrumentation must not begin until H1 Initiative 2 (Escape Hatch) has defined and

enforced terminal-state events on all flows.' Notes updated to reflect Initiative 2 as a prerequisite for Initiative 1 to produce valid ARR data.

- [FIXED] Step 5 (Monetization) introduced '15-day free trial replaces the current try-before-pay friction' as part of the recommended model. This is a concrete operational change — it affects acquisition mechanics, billing configuration, and the activation timeline. But it appeared in no roadmap initiative (Step 3). It had no owner, no success metric, and no H1/H2/H3 horizon assignment. A recommendation with no owner does not get implemented. — Fixed in 03-roadmap.json: the 15-day trial change is explicitly added to H1 Initiative 2 (Activation Redesign) scope — 'Trial mechanics: 15-day free trial (extended from current) is the activation vehicle for this redesign — trial length change is owned by this initiative.' It now has a home, an owner (Product), and a horizon (H1).
- [FIXED] H3 Initiative 1 (Vertical Performance Benchmarks) problem statement contained: 'BotConversa will by H3 have structured booking and conversation data across thousands of beauty salons, clinics, and pet shops.' 'Thousands' is a quantitative value in narrative prose with no claim record — a direct violation of the hard rule 'Never write a quantitative value into narrative text without a claim record.' Worse, the current account count (claim f06) is null. If BotConversa has 300–500 accounts today and grows modestly, 'thousands' may not be true by H3, which would invalidate the benchmark feature's entire statistical premise. — Fixed in 03-roadmap.json: 'thousands' removed and replaced with 'a peer group large enough to generate statistically meaningful benchmarks per vertical and city (minimum peer-group size to be defined at H2 review checkpoint — see claim r06).' Claim r06 added as a placeholder for the statistical minimum, to be determined when account distribution data (claim f09) is available.

P1 — known weaknesses (accepted for this version)

- H2 success metric targets are unsupported by benchmarks: '≥3 active flows per account' (H2 Init 1), '≥50% Appointment Confirmation Rate' (H2 Init 1), '≥40% of accounts with ≥1 CRM field' (H2 Init 2), '≥20% relative reduction in Human Handoff Rate' (H2 Init 2). All four are directional estimates set without industry benchmarks or BotConversa-specific data. They are better than no targets, but they carry false precision. All four must be revisited and justified with H1 baseline data before H2 investment is committed. —
- Claim r02's source field incorrectly references 'claim f01' as the basis for the Appointment Confirmation Rate baseline. f01 is the ARR baseline, not the Appointment Confirmation Rate baseline. The correct reference is f10 (added during P0-A fix). This is a cross-reference error that would produce confusion during the data-request workflow. —
- SocialHub pricing (claim c10, R\$197/month) is marked 'estimate' because the pricing page was blocked by bot protection and could not be directly verified. However, the Step 5 sensitivity table S1 notes reference 'SocialHub's estimated entry price (claim c10)' in a competitive positioning argument. Using an unverified competitor price as a competitive anchor creates a weak argument — if SocialHub's actual entry price is R\$149 or R\$249, the positioning claim inverts. —
- ManyChat pricing (claims c01, c01b) was sourced from third-party blog articles because manychat.com/pricing returned 403. Third-party pricing articles can be 6–12 months stale, especially since ManyChat announced a pricing transition for Brazil in 2026. The Essential plan at \$14/month and Pro plan at \$29/month may not reflect current Brazilian pricing when it launches. —

- The typing error 'Inflating the denominator denominator' appears in 02-framework.json, gamingRisks[3]. Cosmetic, but it will render verbatim in the DOCX appendix. —
- The H3 gating condition in the roadmap objective reads 'Logo Churn Rate dropping to $\leq X\%$ and ARR reaching $\geq Y\%$ ' with literal X and Y placeholders — these are supposed to be filled in from H1 baselines, but the document renders them as symbolic variables, which looks incomplete. The intent is correct but the presentation signals an unfinished document. —

Appendix C — Claim Ledger & Data Request

Every quantitative claim, its status, and where it is used. Unconfirmed rows are the prioritized data-collection plan for the next version.

ID	Claim	Value	Status	Source
c01	ManyChat Essential plan (entry-tier paid) costs \$14/month for 250 active contacts across 2 channels. WhatsApp is not available at this tier.	14USD/month	PUBLIC	https://flowgent.ai/blog/manychat-pricing ; https://setsmart.io/blog/manychat-pricing (direct manychat.com/pricing returned 403; verified via third-party articles 2026-06-12)
c01b	ManyChat Pro plan costs \$29/month for 2,500 active contacts with WhatsApp available. Business plan costs \$69/month for 7,500 contacts.	29/69USD/month	PUBLIC	https://flowgent.ai/blog/manychat-pricing ; https://setsmart.io/blog/manychat-pricing (verified via third-party articles 2026-06-12)
c02	ManyChat charges \$0.02–\$0.08 per WhatsApp conversation as a Meta pass-through fee, on top of the monthly subscription.	0.02–0.08USD/conversation	PUBLIC	help.manychat.com/hc/en-us/articles/14281380243740-WhatsApp-pricing-guide (verified 2026-06-12)
c03	Zenvia Specialist plan costs R\$600/month.	600BRL/month	PUBLIC	zenvia.com/en/prices/ (verified 2026-06-12)
c04	Zenvia Expert plan costs R\$1,800/month.	1800BRL/month	PUBLIC	zenvia.com/en/prices/ (verified 2026-06-12)
c05	Zenvia Professional plan costs R\$3,900/month.	3900BRL/month	PUBLIC	zenvia.com/en/prices/ (verified 2026-06-12)
c06	Zenvia charges a one-time R\$649 activation fee in the first month to enable WhatsApp and/or RCS channels.	649BRL	PUBLIC	zenvia.com/en/prices/ (verified 2026-06-12)
c07	Toolzz Bots Starter plan costs R\$399/month and includes up to 2,000 conversations.	399BRL/month	PUBLIC	https://www.toolzz.com.br/bots (fetched directly 2026-06-12)

c08	Toolzz Bots Pro plan costs R\$699/month and includes up to 10,000 conversations per month.	699BRL/month	PUBLIC	https://www.toolzz.com.br/bots (fetched directly 2026-06-12)
c09	Toolzz Bots Enterprise plan starts from R\$3,900/month for more than 10,000 conversations.	3900BRL/month	PUBLIC	https://www.toolzz.com.br/bots (fetched directly 2026-06-12)
c10	SocialHub's WhatsApp chatbot platform starts from R\$197/month with a 7-day free trial and no setup fee.	197BRL/month	ESTIMATE	socialhub.pro search snippet — pricing page and all blog URLs returned bot-verification screens and could not be fetched directly (2026-06-12)
c11	WATI Growth plan costs \$59/month and includes 5 users, 1,000 free chatbot sessions, and 10 automation flows.	59USD/month	PUBLIC	wati.io/pricing (verified 2026-06-12)
c12	WATI Pro plan costs \$119/month and includes 25 automation flows.	119USD/month	PUBLIC	wati.io/pricing (verified 2026-06-12)
c13	Blip (Take Blip) minimum contract is R\$1,023/month plus Meta pass-through costs. No self-serve plan exists.	1023BRL/month	PUBLIC	botaihub.com.br/ferramentas/take-blip/ (verified 2026-06-12)
c14	WhatsApp appointment reminders reduce no-shows by 30–50% for beauty salons and spas.	30–50%	PUBLIC	aisensy.com 'WhatsApp for Spa and Salons' (2026)
c15	Adding a 2-hour WhatsApp reminder to a 24-hour reminder cuts clinic no-shows by an additional 25–35%.	25–35%	PUBLIC	achiya-automation.com 'WhatsApp Bot for Clinics 2026'
c16	79% of all customer service chatbots in Brazil operate through WhatsApp (SocialHub self-cited; independent verification not confirmed).	79%	PUBLIC	socialhub.pro 'WhatsApp Business AI Brasil 2026' (self-cited statistic)
c17_noshow math	A clinic with 5 no-shows/week at R\$300 avg ticket loses ~R\$6,000/month in unrealized revenue.	6000BRL/month	ESTIMATE	clint.digital '5 Automações de WhatsApp que Mais Aumentam o Agendamento em Clínicas em 2026' (illustrative)

				calculation)
c18	WATI Brazil per-template message costs are approximately 3x higher than India due to Meta's regional pricing tiers.	3x (vs India)	PUBLIC	chatarmin.com 'Wati Pricing 2026' (verified 2026-06-12)
c19	Meta changed WhatsApp Business API billing in Brazil from per-conversation to per-message starting January 2026.	2026-01 effective date	PUBLIC	socialhub.pro 'Preço WhatsApp Business API Brasil 2026'
f01	BotConversa Containment Rate baseline — % of conversations resolved without human intervention (accounts ≥ 30 conv/month).	?%	ESTIMATE	Internal instrumentation required — not publicly available
f02	BotConversa Weekly Active Accounts baseline count.	?accounts	ESTIMATE	Internal instrumentation required
f03	BotConversa median Time-to-First-Automation baseline — days from signup to first live flow with ≥ 1 real conversation.	?days	ESTIMATE	Internal instrumentation required
f04	BotConversa Flow Error Rate baseline — % of conversations hitting an unhandled state or API timeout.	?%	ESTIMATE	Internal instrumentation required
f05	BotConversa monthly logo churn rate baseline — % of paying accounts cancelling per month.	?%/month	ESTIMATE	Internal instrumentation required
f06	BotConversa current MRR and active account count baseline.	?BRL/month	ESTIMATE	Internal financial data required
f07	BotConversa Account Activation Rate baseline — % of new signups publishing a live flow within 14 days.	?%	ESTIMATE	Internal instrumentation required
f08	Median inbound conversations per active BotConversa account per month.	? conversations/month	ESTIMATE	Internal instrumentation required
f09	% of BotConversa paying accounts in target verticals (beauty salons, clinics, pet shops) vs. other verticals.	?%	ESTIMATE	Internal CRM data required
r01	Accounts with only one published active flow (hypothesis: $>50\%$ of paying accounts).	$>50\%$	ESTIMATE	Internal product data required; hypothesis from no-code SaaS category patterns

r02	Target Appointment Confirmation Rate for vertical-template accounts — $\geq 50\%$, baseline unknown.	50%	ESTIMATE	Target set by product team; baseline requires H1 instrumentation (claim f10)
r03	Target Human Handoff Rate reduction (slot-rescheduling, structured CRM accounts) — $\geq 20\%$ relative from baseline.	20% relative reduction	ESTIMATE	Target set by product team; baseline requires H1 instrumentation (claim f04)
r04	Target NRR for accounts engaging with vertical benchmarks $\geq 2x/month$ — $\geq 110\%$, platform-wide NRR baseline unknown.	110%	ESTIMATE	Target set by product team; actuals require H3 launch and 90-day measurement window
r05	Account Activation Rate floor benchmark (no-code SaaS category): 50% within 14 days of signup.	50%	ESTIMATE	No-code SaaS category benchmarks (general industry pattern, not BotConversa-specific); actual baseline requires internal measurement (claim f07)
r06	Minimum peer-group size per vertical/city for statistically valid H3 benchmarks — to be defined at H2 review (depends on f09).	?accounts	ESTIMATE	Statistical peer-group minimum to be defined by data team at H2 review; depends on account count per vertical per city (claim f09)
f10	BotConversa Appointment Confirmation Rate baseline — % of booking-flow conversations exiting with a confirmed appointment.	?%	ESTIMATE	Internal instrumentation required — flow-completion events must be tracked
f11	BotConversa Human Handoff Rate baseline — % of conversations that trigger human escalation.	?%	ESTIMATE	Internal instrumentation required — escalation-trigger events must be tracked
s01	Accounts with ≥ 2 human agents handling escalated conversations (hypothesis: $< 20\%$ of paying accounts).	$< 20\%$	ESTIMATE	Internal CRM data required; hypothesis from vertical target

				profile (beauty salons, clinics, pet shops)
m01	BotConversa monthly operational cost (team + infrastructure + fixed Meta costs, excl. variable pass-through) — estimated R\$50,000/month.	50000BRL/month	ESTIMATE	Estimate based on Brazilian SaaS labor market benchmarks; actual requires internal P&L
m02	Recommended Starter tier price: R\$129/month (flow builder, WhatsApp only, ≤3 published flows).	129BRL/month	ESTIMATE	botconversa.chat/planos-e-precos.html search snippet; direct page fetch blocked
m03	Recommended Pro tier price: R\$249/month (vertical templates, unlimited flows, structured CRM capture). New positioning.	249BRL/month	ESTIMATE	Recommended by strategy; not yet a live price
m04	Recommended Growth tier price: R\$449/month (vertical benchmarks, AI flow optimizer, priority support). New tier aligned with H3 feature delivery.	449BRL/month	ESTIMATE	Recommended by strategy; not yet a live price
m05	Meta API pass-through cost per account at median usage — R\$120/month (~340 conv × R\$0.35). Growth tier accounts: R\$140/month.	120BRL/month	ESTIMATE	Derived from socialhub.pro estimate of R\$0.35/marketing conversation in Brazil (converted from \$0.0625 USD at ~R\$5.60 exchange rate, March 2026 reference); median conversations per account unknown (claim f08)
m06	Monthly cost of a part-time receptionist in Brazil (CLT social charges included): R\$1,200–R\$1,500/month. Pricing ceiling for SMB automation.	1200–1500BRL/month	ESTIMATE	Brazilian minimum wage 2026 (R\$1,518/month) plus approximately 60-80% in CLT social charges; this is the pricing ceiling for WhatsApp automation tools targeting micro-businesses
